"A new trisaccharide sugar chain linked to a serine residue in the
first EGF-like domain of clotting factors VII and IX and protein Z.";
Adv. Exp. Med. Biol. 281:121-131(1990).

-1- FUNCTION: SINGLE-CHAIN PLASMA GLYCOPROTEIN OF UNKNOWN FUNCTION.
-1- SUBCELLULAR LOCATION: EXTRACELLULAR.
-1- TISSUE SPECIFICITY: PLASMA.
-1- TISSUE SPECIFICITY: PLASMA.
-1- SIMILARITY: ALTHOUGH HOMOLOGOUS WITH THE VITAMIN K-DEPENDENT
CLOTTING FACTORS, IT HAS LOST TWO OF THE ESSENTIAL CATALYTIC
RESIDUES AND HAS NO ENZYMATIC ACTIVITY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Calcium;

Identification as the mete gene product.";

Eur. J. Blochem. 263:789-796(1999).

-I- FUNCTION: CATALYZES THE TRANSFER OF A METHYL GROUP FROM METHYLCOBALAMIN AND METHYLCOBINAMIDE TO HOMOCYSTEINE RESULTING IN METHYLCOBININE FORMATION.

-I- COFACTOR: ZINC; BINDS ONE MOLE PER SUBUNIT (BY SIMILARITY).

-I- PATHWAX: TERMINAL STEP IN THE DE NOVO BIOSYNTHESIS OF METHIONINE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        01-OCT-1996

No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 which bind to a zonula occludens toxin (207) receptor, yet do not complysiologically modulate the opening of mammalian tight junctions CC (TJ), The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor CC binding. They can be prepared by chemical synthesis or by use of CC antiinflammatory agents in the treatment of gastrointestinal CC inflammation, where they bind to the ZOT receptor in the intestine CC inflammation, where they bind to the ZOT receptor in the intestine CC inflammation, where they bind to the ZOT receptor in the intestine CC inflammation on this strointestinal inflammation conditions give rise to CC increased intestinal permeability and the peptide is useful for CC increased intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, c.g. conditions that cause protein losing enteropathy CC caused by infection, e.g. Clostridium difficile infection, c.g. congenital satisfication; parasite infestition, bacterial overgrowth, whipple's disease, diseases with collagenous colitis, inflammatory bowel disease, diseases marked by Lymphatic obstruction, e.g. congenital intestinal lymphangiactasia, correction of congenital heart disease with Fontan's operation, collagenous aldiseases withmost ulceration, e.g. Menetrier's disease, e.g. e.g. systemic lupus erythematosus or food allergies, primarily to calle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

CC (PI): The peptide antagonists are based on a common motif of 207 CC and human zonulins, which is believed to be critical for receptor to binding. They can be prepared by chemical synthesis or by use of crecombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal confilmantion, where they bind to the 207 receptor in the intestine cand yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. Clostridium difficile infection, e.g. clostridium difficile infection, cancesal erosion or ulcerations, e.g. gastrifis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastrifis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, correction of congenital heart disease with Fontan's operation, mucosal disease, without ulceration, e.g. Menetries's disease, e.g. systemic lupus erythematosus or food allergies, primarily to milk.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do physiologically modulate the opening of mammalian tight (TJ). The peptide antagening of mammalian

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This peptide comprises the first epidermal growth factor-like domain (EGF-1), i.e. amino acid residues 105-135, of human Zneul (see W88381), a new neuro-growth factor-like protein. Zneul can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. It may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul may also be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W8832-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

Zneul may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

The ORFX CG sequences have activities such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; CC anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; CC cardiant; thrombolytic; cosquiant; vasotropic; antidiabetic; hypotensive; CC dermatological; immunosuppressive; antiinflammatory; antibacterial; CC antiviral; antifungal; antirheumatic; antihlyroid; and antianaemic. The CC sequences can be used for determining the presence of or predisposition CC ORFX-associated disorder. The nucleic acids can be used to express ORFX CC used to treat cancers, proliferative disorders, neurodegenerative CC used to treat cancers, proliferative disorders, neurodegenerative CC disorders, osteoarthritis, graft vs host disease, cardiovascular disease, CC (Acabetes mellitus, hyportension, hypothyroidism, cholesterol ester CC (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune CC (artilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.

(A) are identified by assembling EST'S (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTs from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue, y59838-y59892 represent protein fragments encoded by the human uterine tissue derived cDNA fragments represented in 241325-241385.
    Y52138-Y52140 are amino acid sequences of (T125). The T125 protein (Y52137) has two

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel cDNA sequences (A) highly expressed in normal uterine tissue which can have anticancer and cytostatic activity and can be used for gene therapy. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (EGF)-like domains at amino acids 107-134 and 141-176 and is predicted to have a molecular weight of approximately 30kD. T125 is predicted to have no transmembrane domains and appears to be a secreted protein. The sequences of all variants of T125 are used in the invention to create antibodies which selectively bind to T125. The T125 polypeptide is used to modulate a variety of cellular processes. It can be used to produce fusion proteins. The protein may also be used to produce antibodies, and to identify T125 antagonists and agonists. The T125 polypucleotides, polypeptides, homologues and antibodies can be used in screening assays; predictive medicine; and methods of treatment of T125 associated disorders. The T125 polypucleotides can be used to express the protein; to detect T125 mRNA; to detect genetic alterations in the T125 gene; in forensic biology; and as a source of primers and probes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This polypeptide comprises human Zneul mature polypeptide. Zneul Closest human homologue is HSMHC3M5A, a gene in the HLA class III Closest human homologue is HSMHC3M5A, a gene in the HLA class III Cregion, which is contained in a cosmid which contains Notch 4.

Zneul is also homologues to Notch 4 in its EGF-like domains and may compared to the contains of the contains and may compared to the contains which is contained in the EGF core pathways. Zneul is widely expressed in adult tissues, with high expression in heart, placentet, spleen, core in the spinal cord and lymph node. Zneul can be used as growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. It may cord, heart, spleen, testis, thyroid and lymph nodes. It may cord, heart, spleen, testis, thyroid and lymph nodes. It may cord, adenomas. Zneul may also be used to treat Alzheimer's disease, cord adenomas. Zneul may also be used to treat Alzheimer's disease, cord, to repopulate blood cells after chemotherapy, to stimulate cord made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W8838-97), cord including specific domains of Zneul and epitope-bearing portions of cord including specific domains of Zneul and epitope-bearing portions of cord increase and contraception.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    C C74446 to C77606 encode the proteins given in B40237 to B43397, which crepresent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiporiatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antibacterial; c dermatological; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative c disorders, osteoarthritis, graft vs host disease, cardiovascular disease, storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune c disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and c cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. Z33891 to Z34338, and Y41685 to Y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 23891 to 234338, and v41685 to v41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                                                              Homo

                                                                                                                                                                                                                                                                                             The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 233891 to 234338, and Y41685 to Y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              15 MAY -1998;
